Console lets you view all kinds of logs, so some of the messages may be a bit difficult to understand if you're not a Unix geek.. Easily parse, view and filter your application's log files LogDiver is designed to quickly import events from multiple application log files giving you a holistic view of events occurring within the same timeframe.. And that server can provide a decent amount of information without needing to get into the level of auditing you're getting at.

Edited Jun 15, 2015 at 12:11 UTC You're asking an awful lot Is that really truly a need, or a more fantastical wish? Seriously: What is driving the kind of need you're describing? Is there - in fact - an established, business-case need or is a misguided owner/manager wishing for this? Log Viewer For Mac What is the workflow, and why are critical assets (since you want to know everything about anything changed with regards to some files) not being stored centrally on the server.. On client machines, Spotlight will provide an index of file-level information but isn't geared - at all - towards documenting changes beyond file creation & modification dates and you would have to correlate that with the current login at that time which is available in the system log.. In 10.7 ('Lion') Server and later with the AFP file service, file (open, delete & more) are logged to /Library/Logs/AppleFileService/AppleFileServiceAccess. [Apple Mac Pro 1.1 Manual](#)

1 free download for mac Please show me the soup-to-nuts write-up of that for Windows, because I think you're asking for something that doesn't exist for any platform;-) Keep in mind all of the files that get modified by process that start & run as (owned by) the user that logs in, so all of those files would be logged, none of which are - probably - the ones you want to know about.. The key question is how are users getting access to those files? Are you actually wanting to AUDIT all file-actions for local, end-user stations? And sent to a central syslog server? FreeMat 4.. Set the result(s) to log to a file of your choosing, with appropriate log rotation, and periodically email that log to a destination of your choice.. log Important: However, that log is NOT enabled by default but can be using the Terminal to invoke the command: sudo serveradmin settings afp:activityLog = yes The log will show initial login with IP address and username.. FWIW we're running 10.7 and 10.8 versions of mac os in our environment What file service on your server? AFP by default.. OS X has VERY good, innate abilities with regards to monitoring file access, but one similarity to the cautions on the Windows side are: The extent to which you want to log EVERYthing is the extent to which you are going to add so much overhead as to cause truly SERIOUS, probably deleterious degradation of performance and needed services.. Log View For Mac Windows 10 Or pull the log via ssh/rsync To be more specific we just want to capture anytime either a logged in user or remote user (through file shares) access a file on the mac and what they changed, whether they moved it, copied it, deleted it, or changed it.. I'm having a difficult time finding a way to just monitor and log file changes not made by the system but by a person. b0d43de27c [Ism Cummins Torque Specs](#)
